mounting orientation matches the orientation specified on the

conduit openings) should be accessible for service.

MARNING

Read all instructions prior to installing, operating and servicing this product.

Follow all warnings, cautions and instructions marked on and supplied with this product.

Install your equipment as specified in the installation instructions in the appropriate instruction manual and per local and national codes. Connect all products to the proper electrical and pressure sources.

i Ensure that all equipment doors are closed and protective covers are in place, except when maintenance is being performed by qualified persons, to prevent electrical shock and personal injury.

Do not operate this instrument in excess of the specifications marked on and supplied with this product. Failure to heed this warning can result in serious personal injury and/or damage to the equipment.

broperly terminated. broperly terminated.

If your mass flow product operates with current I/O it sources its own 4-20mA output signal. Do not source this output with an external supply.

If your mass flow product operates with current I/O it is an input sinking device

NOITUAD

If it becomes necessary to remove the device from the system after exposure to toxic, pyrophoric, flammable or corroscive gas, purge the device thoroughly with a dry inner gas such as nitrogen before disconnecting the gas connections Failure to correctly purge the device could result in fire, explosion or death.
Corrosion or contamination of the device upon exposure to ali may also occur.

Do not use a current sinking PLC output card.

Incorrect voltage will cause flowmeter damage or failure.

If it becomes necessary to remove the device from the system, power to the device must be disconnected.

Step 2: Mounting the Controller to a Plate, Shelf or Panel

[42.0]

Any rotation of the inlet or outlet fitting during installation of a metal seal device may result in a leak. Always use two wrenches when attaching process line to prevent rotation.

Step 4: Remote Electronics Box

The remote electronics box can be mounted in any position that is convenient and within reach of the high temperature cable. The temperature limit of the electronics is 0-50°C (32°F -122°F).

Connect the remote electronics box with the controller utilizing the 15-pin D sub connector on the end of the cable which is wired to the remote electronics box.

Step 5: Electrical Connections

5

To insure proper operation, the Model 585xEMH must be connected per Figure 5.

As a minimum, the following connections must be made: **Voltage I/O Version**

- Chassis Ground (Pin 14)
- Signal Common (Pin 10)
- Signal Output (Pin 2)
- +15 Vdc Supply (Pin 5)
- -15 Vdc Supply (Pin 6)

Each device is factory adjusted to provide a flow signal of zero volts $(\pm 10 \text{ mVdc})$ at zero flow. The adjustment is made in our calibration laboratory which is temperature controlled to the temperature specified at the time of order. After initial installation and warm-up in the gas system, the zero flow indication may be other than the factory setting. This is primarily caused by changes in temperature between our calibration laboratory and the final installation. The zero flow reading can also be affected, to a small degree, by changes in line pressure and mounting attitude.

To check zero, always mount the controller in its final configuration and apply power to the instrument and any associated heaters for 60 minutes to reach a stable thermal condition prior to applying flow. Flow the process fluid into the instrument and allow sufficient time for the sensor to reach normal operating temperature.

Note: Before zeroing the instrument, zero pressure differential MUST be established across the device. If there is pressure across the instrument during the zero process, any detected flow through the sensor will be misinterpreted as the zero flow reading. This will result in calibration inaccuracy during normal operation.

Close the shutoff valve downstream of this instrument to eliminate any pressure differential across the instrument. Once zero differential pressure is established and verified, check the flow output signal using a suitable voltmeter. If it differs from the factory setting, adjust it by removing the lower pot hole plug (refer to Figure 4) which is located closest to the 7-pin circular connector on the remote electronics module. Adjust the zero potentiometer until the desired output signal is within +/- 10 mV of zero on the output of the device.

Step 6: Operation

After the flow controller has been installed in the system it is ready for operation.

<u>Controller</u>: You must provide a setpoint/command signal to the controller. The controller will read the setpoint signal and will automatically adjust the valve to the appropriate position to achieve the desired flow and will provide a flow signal proportional to the full scale flow of the device as indicated on the device label.

Equipment Receipt and Return Procedures

Receipt of Equipment

When the equipment is received, the outside packing case should be checked for damage incurred during shipment. If the packing case is damaged, the local carrier should be notified at once regarding his liability. A report should be submitted to the nearest Brooks Instrument location listed on the Global Service Network page on our website: brooksinstrument.com/service-support

Remove the envelope containing the packing list. Carefully remove the instrument from the packing case. Make sure spare parts are not discarded with the packing materials. Inspect for damaged or missing parts.

Return Shipment

Prior to returning any instrument to the factory for any reason, visit our website for instructions on how to obtain a Return Materials Authorization Number (RMA #) and complete a Decontamination Statement to accompany it: *brooksinstrument.com/service-support* All instruments returned to Brooks also require a Material Safety Data Sheet (MSDS) for the fluid(s) used in the instrument. Failure to provide this information will delay processing of the instrument. Instrument must have been purged in accordance with the following:

Before returning the device, purge thoroughly with a dry inert gas such as Nitrogen before disconnecting process connections. Failure to correctly purge the instrument could result in fire, explosion or death. Corrosion or contamination may occur upon exposure to air.
